PV102 Day 1 Whiteboard Outline

Use when presenting without the slide deck or to anchor discussion

Board 1: job	Board 2: path	Board 3: proof

Whiteboard Outline | Audience: Instructor | Monday, August 3, 2026

Board 1 - Start with the job

- LOAD: what must run?
- TIME: when and for how long?
- SITE: what helps or blocks the system?
- NEED: bill reduction, resilience, remote service, or process operation?

Board 2 - Four architectures

- Grid-tied: PV + utility
- Hybrid: PV + storage + utility
- Off-grid: PV + storage + load
- PV-direct: PV + compatible daytime load

Board 3 - Design acceptance

- Match the need.
- Show the energy path.
- Name the dominant constraint.
- State the safety boundary.
- Record unknowns; do not guess.

Scenario reveals

Scenario	First-pass architecture	Decision signal
Remote trail counter	Off-grid	No utility; must run day and night
Small shop	Hybrid	Bill reduction plus defined backup loads
Daytime pump	PV-direct	Load can wait for sun; water tank stores the service

Final board sentence

The best PV system is the one matched to its real job.
